Definition of Jets in a Large Background

- **Organizers:** M. Connors, G. Milhano, C. Nattrass, R. Reed, S. Salur
- **Spectra conveners:** R. Kunnawalkam Elayavalli, Y. Mehtar-Tani (R. Bertens)
- **Correlation conveners:** J. Noronha-Hostler, J. Huang
- **Substructure conveners:** Y. Lee, Y. Chien

62 Registered but due to various visa & travel complications: 45 + several BNL employees attended.

GOAL

Extensively discussed the interplay between experimental techniques and theoretical calculations with the aim of **reaching an agreement*** on the way forward for extracting jet measurements from large background events such as those in heavy ion collisions and high luminosity p-p or electron-ion collisions.

*Consensus on some points

***Include anything correlated
in definition of jet***

***Provide enough details to
make comparisons
between data and models***

***Reconsider role of
collinear safety***

Discuss and put effort into the problem

Signal vs Background: the standard paradigm

Background

Signal

...even in Monte Carlo!

Snowmass Accord: Theoretical calculations and experimental measurements should use the same jet finding algorithm. Otherwise they will not be comparable.

RIVET

Robust Independent Validation of Experiment and Theory

The Lisbon Accord

An aerial photograph of a narrow street in Lisbon, Portugal, showing a dense cluster of buildings with characteristic red-tiled roofs. In the background, a hill with a castle or fortress is visible under a bright sky.

- [Lisbon Accord](#) proposed that heavy ion analyses adopt RIVET in July 2014
- Workshop position paper will second this recommendation

Problems with RIVET

- Not all heavy ion functionality exists
- Very few heavy ion analyses exist
- Only takes in HEPMC 2.0 input
- No way to deal with fluctuations

Few heavy ion analyses in RIVET

RIVET-HI

<https://github.com/alisw/rivet-hi>

- ALICE extended RIVET to enable heavy ion analyses (*Przemyslaw Karczmarczyk, Jochen Klein, Jan Fiete Grosse-Oetringhaus*)
- Adds centrality determination
- No option to fit functions

Undergraduates!*

Abstract

National efforts to transform undergraduate biology education call for research experiences to be an integral component of learning for all students. Course-based undergraduate research experiences, or CUREs, have been championed for engaging students in research at a scale that is not possible through apprenticeships in faculty research laboratories. Yet there are few if any studies that examine the long-term effects of participating in CUREs on desired student outcomes, such as graduating from college and completing a science, technology, engineering, and mathematics (STEM) major. One CURE program, the Freshman Research Initiative (FRI), has engaged thousands of first-year undergraduates over the past decade. Using propensity score–matching to control for student-level differences, we tested the effect of participating in FRI on students' probability of graduating with a STEM degree, probability of graduating within 6 yr, and grade point average (GPA) at graduation. Students who completed all three semesters of FRI were significantly more likely than their non-FRI peers to earn a STEM degree and graduate within 6 yr. FRI had no significant effect on students' GPAs at graduation. The effects were similar for diverse students. These results provide the most robust and best-controlled evidence to date to support calls for early involvement of undergraduates in research.

Phys 494 – Course-based Undergraduate Research Experience in Relativistic Heavy Ion Physics

Office hours: TBA

Teaching assistant: N/A

Class time & Location: TR 12:40-1:55 SERF 210

Course Description:

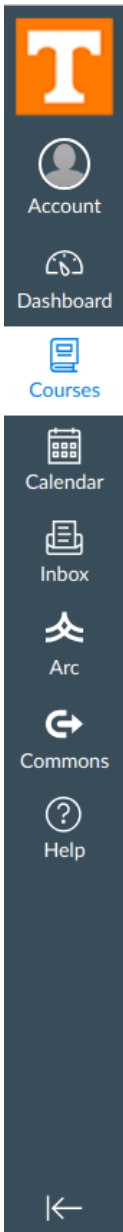

This course will incorporate undergraduates into a research project in high energy nuclear physics in a course setting. Each student will be responsible for implementing a heavy ion analysis in the program RIVET so that it can be used by the JETSCAPE collaboration to make comparisons between Monte Carlo models and data. Each student's project will be incorporated into a public software repository so that it is available to the field and, if possible, it will be validated by the relevant experiment and incorporated into the official RIVET software.

Extra credit possibility

Jan 12 at 10:36am

[Christine Elizabeth Natrass](#)

[All Sections](#)

There is an extra credit opportunity which will be applied to the final project for up to 10% of the final project grade. Any students who contribute can get at least part of this extra credit. The total allocated is not restricted to 10% so that if two students work together and make equal contributions, they could both earn up to 10%.

The output of the JETSCAPE Monte Carlo models is in HEPMC 3 format, which is a structured text file containing information about the event. RIVET is only compatible with HEPMC 2 and the changes required to make it compatible with HEPMC 3 are non-trivial. You can read more about HEPMC formatting here: <http://hepmc.web.cern.ch/hepmc/> and we will reach a point in the semester when you are using some HEPMC output as input for your code.

In order to be able to use the results of this semester to compare to JETSCAPE results, we need a program which will convert HEPMC 3 files to HEPMC 2. HEPMC 2 files contain less information than HEPMC 3 files.

The ideal program would be

- Compatible with nearly any Linux system
- Uploaded to a git repository for general use
- Convert output on the fly so that the HEPMC 3 output does not need to be saved
- Be robust to output from multiple Monte Carlo generators

Any language may be used, but the first requirement restricts it to common languages such as python. If a version were available earlier in the semester, it may be possible to get outside input for the last point. I will eventually need access to the git repository so that I can maintain it.

While it is not clear to me how difficult it would be, an additional task would be to write a HEPMC 2 to 3 converter would also be useful.

Final allocation of extra credit will be at the end of the semester when the project is due, although some credit may be allocated earlier.

Problems with RIVET

- Not all heavy ion functionality exists ✓
- Very few heavy ion analyses exist ✓ (in progress)
- Only takes in HEPMC 2.0 input ✓ (in progress)
- No way to deal with fluctuations

Ways to deal with fluctuations

- Tag final state hadrons as part of signal or background and only put these into jet finder
 - May work OK but conceptually suboptimal
- Compare to data which have not been corrected for fluctuations in the background
- Unfold Monte Carlo results
 - Treating MC just like data
 - Unfolding is highly non-trivial

Conclusions

- Jet background is tricky
- It will be an issue for JETSCAPE
 - Especially fluctuations!
- RIVET(-HI) is progressing
- Undergraduates are great!

13th International Workshop on High- p_T Physics in the RHIC/LHC Era

**The Past, Present, and Future
of Heavy Ion Collisions
March 18**

**A symposium in celebration of
Miklos Gyulassy's 70th birthday**

Registration deadline: Jan. 19, 2019

Registration fee: \$170 (\$120 students)
