Daniel Beagan

Outline

- **Why Truck Models?**
- **Options for Memphis**
- **Development of External truck model**
- **Development of Internal truck model**

Why Truck Models?

- Trucks contribute to congestion
 - » 23 CFR 450 Congestion Management Process (c)(1) Methods to ...identify and evaluate alternative strategies, ...
- Requirement to study freight
 - » 23 CFR 450.306(a)(4) Increase accessibility and mobility of people and **freight**;
 - » 23 CFR 450.306 (a)(6) Enhance the integration and connectivity of the transportation system,..., for people and **freight**;

Memphis Truck Model

- **Freight is carried primarily by truck**
 - » **According to the FAF3:**
 - **67% of the tons to/from/within TN Mem(phis) are by truck**
 - **64% of the truck tons are IE/EI**
- **Trucks primarily travel to provide services**
 - » **From the FAF3 network in the TN Mem(phis) zone:**
 - **609 center line highway miles**
 - **35% of the DVMTT are by trucks that carry FAF freight**
 - **65% of the truck DVMTT are by service (Non-FAF) trucks**

Memphis Truck Model

- **Estimation process**

- » **Two models:**

- E-E/E-I/I-E (a.k.a. External) and
 - I-I (a.k.a. Internal).

- **Estimation databases**

- » **External - which is dominated by commodity truck flows, use a commodity flow database**

- i.e. TRANSEARCH

- » **Internal- which is dominated by service trucks, use a database that contains both freight and service trucks**

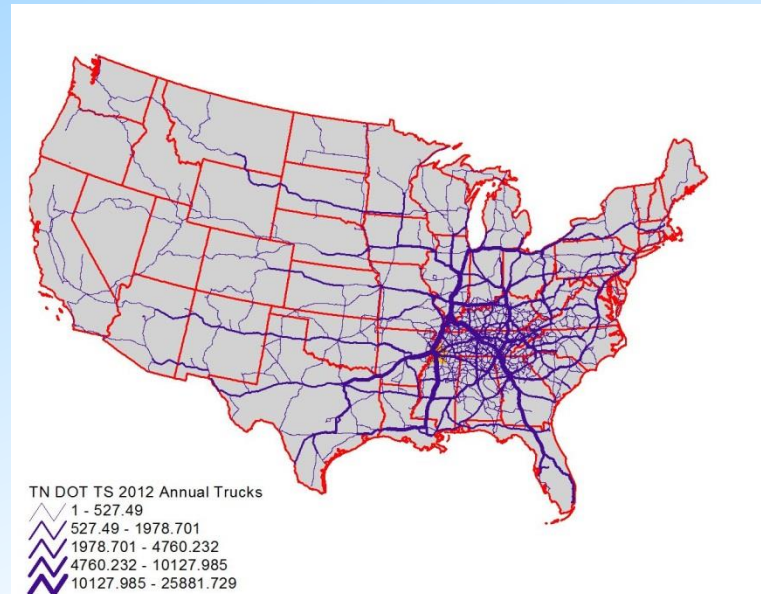

- i.e. ATRI GPS.

External Truck Model

- **Develop Estimation Databases**
- **Develop Commodity Groups**
- **Develop Trip Generation Equations**
- **Develop Trip Distribution Equations**

External Estimation Database

- Obtain and process
**TnDOT
TRANSEARCH**
- Window to
**Memphis MPO
model boundary**

Commodity Groups

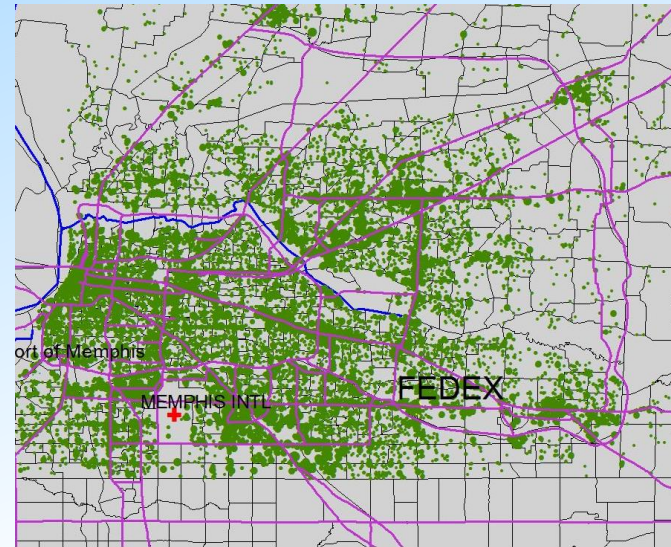

Commodity Group (CG) Name	CG #	SCTGs in CG	Daily Trucks Produced from I (of IE)		Daily Trucks Attracted to I (of EI)	
Farm Products	1	SCTGs 01-05	222	6%	1,122	28%
Food Products	2	SCTGs 06-09	262	7%	242	6%
Sand and Gravel	3	SCTGs 11-15	277	7%	990	24%
Gasoline & Fuel	4	SCTGs 16-19	277	7%	324	8%
Chemicals	5	SCTGs 20-23	167	4%	47	1%
Non-Durable Manufacture	6	SCTGs 24-30	91	2%	134	3%
Clay, Concrete, Glass	7	SCTG 31	343	9%	168	4%
Durable Manufacture	8	SCTGs 32-40	120	3%	141	3%
Waste	9	SCTG 41	232	6%	74	2%
Secondary and Mixed Freight	10	SCTG 43 & SCTG 50	1,859	48%	827	20%
Total			3,850	100%	4,068	100%

External Model Trip Generation Equations

- **Internal (TAZ) Truck Trips ends**
 - » Develop NAICS3 employment by TAZ as explanatory variables.
 - » For each CG, for Internal Counties, identify best explanatory variable and rates for Production and Attraction equations
- **External (Station) Truck Trip Ends**
 - » Estimate from windowed TRANSEARCH
 - » FRATAR to observed truck counts

Develop NAICS3 Employment

- Obtain and process TNDOT Infogroup data
- Obtain and process Infogroup data for AR & MS Counties
- Result is NAICS3 employees per TAZ

Infogroup naics3 emp 3 tn counties.shp

External Ps and As

- Seed table is Windowed TRANSEARCH
- Row and column constraints are truck counts at External Stations
 - » No constraints for Internal counties
- FRATAR seed to counts
 - » O External Station summed over all Internal D TAZs = E-I P
 - » D External Station summed over all internal O TAZs = I-E A
 - » O External Station to D External Station is E-E

External Truck Model

Trip Distribution Equations

- **Use a Gravity Model**

- » **Productions and Attractions from preceding**
- » **“k-factor” set to zero for all I-I and E-E interchanges**
- » **“Friction Factor “ is a negative exponential function of distance**
 - **Coefficient is inverse of Average Trip Length (ATL)**
 - ◆ ATL varies by CG
 - ◆ Develop from Windowed TRANSEARCH
 - **Distance within region from network skim**
 - **Distance outside of region as reported in windowed TRANSEARCH**
 - ◆ Varies by CG and External Station

$$T_{ij} = \frac{k_{ij} P_i A_j F_{ij}}{\sum_{j=1}^n k_{ij} A_j F_{ij}}$$

$$F_{ij} = e^{-c * d_{ij}}$$

$$d_{ij} = di_{ij} + do_{ij}$$

External Truck Model

Trip Distribution Factors

Commodity Group		Average Trip Length (miles)	Weighted Distance (mi) TS External Zones to Memphis External Stations	
Code	Name		I-40,TN	I-55, MS
1	Farm products	318	236	271
2	Food products	560	292	477
3	Sand and Gravel	307	229	309
4	Gasoline & Fuel	255	173	293
5	Chemicals	571	408	447
6	Non-Durable Manuf	517	335	430
7	Clay, Concrete, Glass	235	112	270
8	Durable Manuf	589	310	456
9	Waste	319	233	336
10	Secondary and Mixed Freight	406	284	505

Internal Truck Model

- **Pivot from QRFM equations**
 - » Light, Medium and Heavy trucks in QRFM
 - » Heavy Trucks in ATRI
- **Develop Trip Generation Equations**
- **Develop Trip Distribution Equations**

Internal Truck Model

Trip Generation Equations

- All (TAZ) Truck Trips ends
 - » Develop QRFM “employment” by TAZ as explanatory variables.
 - » Use ATRI truck table as “observed” variable
 - By TNDOT SWM TAZs
 - » For heavy trucks, develop rates for TG equations
 - For TN DOT SWM TAZ in Tennessee
 - ◆ Sum QRFM variables from Memphis TAZs to SWM TAZs

Internal Model Trip Generation Rates

QRFM Trucks				ATRI trucks
Variable	Light	Medium	Heavy	TN SWM TAZs
				R²=0.652
Agriculture, Mining and Construction	1.110	0.289	0.174	0.504
Manufacturing, TCU and Wholesale Trade	0.938	0.242	0.104	0.942
Retail Trade	0.888	0.253	0.065	0.784
Office and Services	0.437	0.068	0.009	0.0001
Households	0.251	0.099	0.038	0.0001

QAQC of ATRI Table on Memphis Network

- **ODME**
 - » **ATRI table (I-I within Memphis as seed)**
 - » **Memphis MPO highway network**
 - » **Crosswalk between TN SWM TAZs and Memphis MPO TAZs**
 - » **Combination Unit truck counts as constraint**
- **Factored seed table by average of 1.72**
- **Consistent with I-I trips as 58% of all CU truck trips**

Internal Model Trip Generation Rates

Adjusted Rates trucks/day per employee (household)			
Variable	Light	Medium	Heavy
Agriculture, Mining and Construction	3.2152	0.8371	0.504
Manufacturing, TCU and Wholesale Trade	8.4961	2.1920	0.942
Retail Trade	10.7106	3.0516	0.784
Office and Services	0.0049	0.0008	0.0001
Households	0.0007	0.0003	0.0001

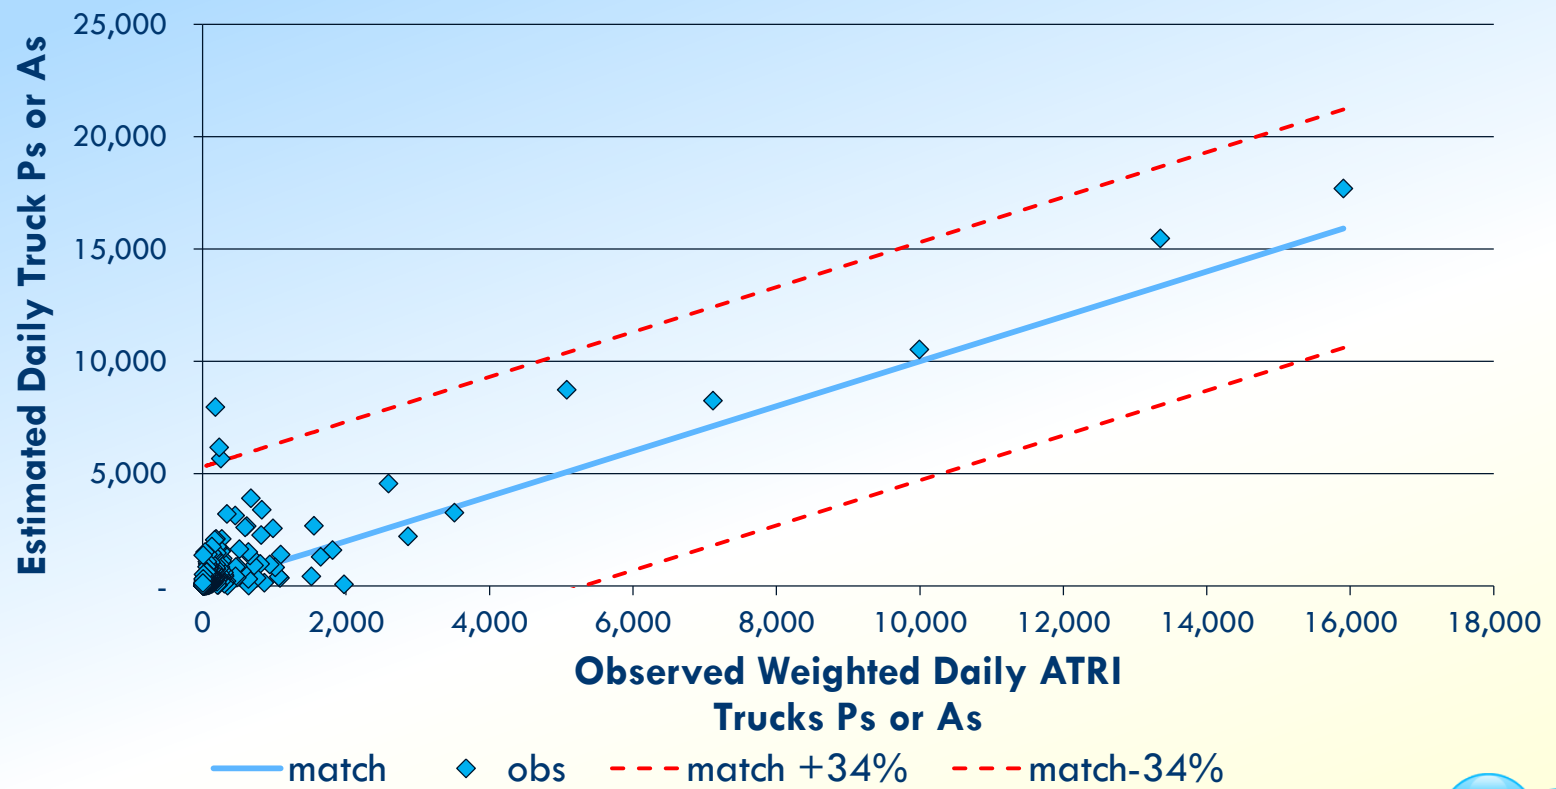

Outliers from regression

- Outliers defined as those whose observed trips are more than $\pm 34\%$ ($\frac{1}{2}$ SD) from estimated trips.
- Difference between observed trips and band of $\frac{1}{2}$ SD is assumed as special generator value.

SWM TAZ	ATRI	From rates	Special Generator	Estimated	Facility
2456	15,905	5,751	11,939	17,690	BNSF Memphis IM Yard
2457	13,355	6,662	8,801	15,463	BNSF Memphis IM Yard
2484	7,119	3,518	4,720	8,238	BNSF Memphis IM Yard
2518	9,997	1,682	8,839	10,522	Port of Memphis

Internal Truck Model Trip Generation

ATRI II Ps and As TN SWM TAZs

Internal Truck Model

Trip Distribution Equations

- **Use a Gravity Model**

- » **Productions/Attractions from preceding**
- » **“k-factor” set to zero for all but I-I interchanges**
- » **“Friction Factor “ is a negative exponential function of time**
 - **Coefficient is computed by TransCAD**
“Calibrate Gravity Model”
 - ◆ **AM skim times from Memphis MPO model**
 - ◆ **“Observed” ATRI truck table**

$$T_{ij} = \frac{k_{ij} P_i A_j F_{ij}}{\sum_{j=1}^n k_{ij} A_j F_{ij}}$$

$$F_{ij} = e^{-c * t_{ij}}$$

Internal Truck Model

Friction Factor Coefficients

QRFM Trucks			ATRI trucks	
Category	Coeff	1 / Coeff	Coeff	1 / Coeff
Light	-0.08	12.5 min	-0.249	4.02 min
Medium	-0.10	10.0 min	-0.310	3.22 min
Heavy	-0.03	33.3 min	-0.093	10.7 min

Combined Truck Model

- **Tables from Internal and External Truck Models are combined prior to assignment.**
- **Internal Truck Trip ends are function of SED in each TAZ**
- **Distribution of trips within Memphis model is based on network skims.**
